

Adsparkx AI Platform: Password Reset, MFA & SSO Configurations

This document outlines the official guidelines for managing account credentials, configuring Multi-Factor Authentication (MFA), and setting up Enterprise Single Sign-On (SSO).

1. Password Recovery Flow

If you have lost your credentials or are locked out of your account, follow these steps to reset your password:

- Step 1: Navigate to the login portal at <https://console.adsparkx.ai/login> and click the 'Forgot Password' link.
- Step 2: Enter your primary registered email address. Ensure it matches the email used during subscription registration.
- Step 3: An automated secure verification token will be sent to your email. This token remains valid for precisely 15 minutes.
- Step 4: Click the link inside the email or enter the 6-digit verification code on the recovery page.
- Step 5: Specify your new password. Passwords must be at least 12 characters and contain uppercase, lowercase, numbers, and symbols.

2. Multi-Factor Authentication (MFA) Setup

To protect your developer endpoints and billing data, we require MFA configuration:

- Step A: Go to Account Settings -> Security Console -> Multi-Factor Authentication.
- Step B: Click 'Enable MFA'. A unique QR code and backup recovery key will be generated.
- Step C: Scan the QR code using an authenticator application (e.g., Google Authenticator, Authy, or Microsoft Authenticator).
- Step D: Input the 6-digit TOTP code displayed in your authenticator app to complete activation.
- Step E: Securely print or store the 16-character backup recovery key in a physical safe. These recovery keys bypass MFA if your device is lost.

3. Enterprise Single Sign-On (SSO) Integration

Enterprise clients can configure Identity Providers (IdPs) like Okta or Azure AD using SAML 2.0 or OIDC:

- Point your Identity Provider's Assertion Consumer Service (ACS) URL to <https://auth.adsparkx.ai/saml/acs>.

- Set the Audience URI / Entity ID to **<https://auth.adsparkx.ai/saml/metadata>**.
- Upload your IdP XML metadata document in the Adsparkx security console under SSO Settings.
- If authentication fails, ensure the SAML assertion signs both the response and the assertion element, and attributes are set in lowercase.

4. Troubleshooting Account Lockouts

If you lose your authenticator device and have misplaced your backup recovery key, you must contact our Enterprise Support team at **security@adsparkx.ai**. For compliance and data security reasons, manual account recovery requires identity verification, which can take up to 24-48 business hours to complete.
